

## **DESCRIPTION OF REPLICATION PROGRAMS THAT ACCOMPANY PAPER: Reis, Ricardo (2009) "Optimal Monetary Policy Rules in an Estimated Sticky Information Model." American Economic Journal: Macroeconomics, forthcoming.**

Written by: Ricardo Reis, 26 January 2009.  
Please cite if you use. I do not provide tech. support

All of the programs were written for Matlab version 7.

### **1. REPLICATION INSTRUCTIONS**

First, you must obtain the suite of estimation files for this class of models SIBE (sticky-information Bayesian estimation). Follow the instructions in that file to generate Chile\_USGpost.mat and Chile\_EMUpst.mat using the data USGdata.mat and EMUdata.mat respectively. In particular note the number of draws, chains, and so on described in the paper. (You can skip this step. If you want to get the post.mat files directly e-mail me; they are about 70Mb each).

Next, you must obtain the suite of files to study optimal policy in this class of model SIPR (sticky-information policy rules). Put it in some directory and update the path instructions in some of the files to reflect that directory.

Finally, you can run the files: [OMPR\\_Table1.m](#), [OMPR\\_Table2.m](#), [OMPR\\_Table3.m](#), [OMPR\\_Table4.m](#), [OMPR\\_Table5.m](#), [OMPR\\_Table6.m](#), [OMPR\\_Table7.m](#), [OMPR\\_Table8.m](#), [OMPR\\_Table9.m](#), [OMPR\\_figures.m](#), [OMPR\\_cis.m](#) to obtain all the figures and tables in the paper.

### **2. LIST OF ALL THE FILES**

#### **Master programs:**

[OMPR\\_figures.mat](#) Computes all the figures  
[OMPR\\_Table1\(to9\).mat](#) Computes each of the tables in the paper  
[OMPR\\_cis.mat](#) Computes indifference intervals  
[OMPR\\_Optimalpolicy.mat](#) Calculates optimal policy rules all at once  
[OMPR\\_robpy.mat](#) Calculates robust price-targeting rule  
[OMPR\\_robtr.mat](#) Calculates robust interest-rate rule  
[OMPR\\_Robustpolicy.mat](#) Calculates robust policy rules performance

#### **Input files:**

[Prior\\_pars.mat](#) has the prior parameters;  
[USGdata.mat](#) has the USG data.  
[OMPRrobdraws.mat](#) Draws for computing robustly optimal policies  
[OMPR\\_USGopt.mat](#) Optimal policy results  
[OMPR\\_EMUopt.mat](#) Same for EMU  
[OMPR\\_USGrobtr.mat](#) Robustly-optimal interest-rate rule  
[OMPR\\_USGrobpy.mat](#) Robustly-optimal price-targeting rule  
[OMPR\\_USGrob.mat](#) Histograms from robustness exercises  
[OMPR\\_USGpost.mat](#) Posterior distribution draws for USG

OMPR\_EMUpost.mat Same for EMU  
OMPR\_USGpost\_stats.mat Descriptive statistics from posterior distribution  
OMPR\_EMUpost\_stats.mat Same for EMU  
OMPR\_USGtable1.mat Auxiliary file for table 1 to avoid repeating the same calculations every time

**Programs called:**

OMPRmoments.m Computes serial correlations and accelerationist Phillips correlation  
OMPRmomentssim.m Computes moments for many different parameter draws  
OMPRvd.m Computes variance decompositions  
SIGEm4.m solves the model for 4 variables  
SIGEm5.m solves the model for 5 different variables  
OMPR\_optpy1.mat Optimal price-targeting rule at priors  
OMPR\_optpy2.mat Optimal price-targeting rule with single-stickiness  
OMPR\_optpy3.mat Optimal price-targeting rule with single-stickiness  
OMPR\_opttr1.mat Optimal interest-rate rule at priors  
OMPR\_opttr2.mat Optimal interest-rate rule with single-stickiness  
OMPR\_opttr3.mat Optimal interest-rate rule with single-stickiness  
OMPR\_robdraws.mat Set draws for computing robustly optimal policies
